TITLE : CARD SHEET

ABSTRACT : PURPOSE: To form a high quality card sheet at low cost by providing a recording storage layer on one end of a base where polyethylene terephthalate film of specific thickness is provided on the both sides.

CONSTITUTION: PE film with 12 to 38 μm thickness, for instance, the film with 25 μm thickness, is provided on both sides of a base 1. In addition, a magnetic layer 4 as a recording storage layer and a protection layer 5 for protecting the magnetic layer 4 are provided on the PE film 2 side. The PE film is considerably thinner than a conventional PE film, so that its combined two layers are significantly thin. Thus the consumption of PE film is saved significantly.
